

UDDER CLEFT APPLICATION GUIDE

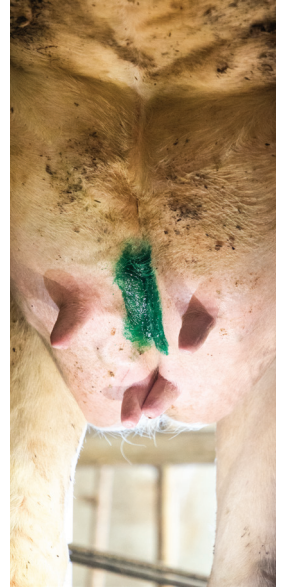

Instructions

1. Clean and dry the affected area.
2. If pre-applying compatible treatment underneath, allow to dry before application of NoBACZ Bovine.
3. Using a gloved hand, apply the product to create a thin, even layer up to 2mm depth. Allow to air dry ~1 minute.
4. Re-apply after 48-96 hours if necessary.
5. More established cleft issues may take longer to resolve so early identification and application of NoBACZ Bovine is advisable.

If exudate is expected from the site then re-apply on consecutive days until the site is dry before observing the above re-application intervals.

Additional Information

It is advisable to first test a small patch of skin in case of hypersensitivity.

Top Tip

For sand bedding – to prevent removal of product before cure, it is advised to observe a longer set time before contact with the bedding. For best results, prevent contact with sand for 1 hour after application.
