

Protect lambs and calves with a rapid setting, long-lasting solution for navel dipping

A purpose-built solution for navel dipping

Newborn livestock are very susceptible to disease and one of the main routes of infection is the umbilical cord. When calves and lambs are born, the umbilicus is essentially an open wound, not only does this allow infection of this area but it also permits bacteria to track up into the new born animal resulting in infections of internal organs and the joints. Navel infections are a significant cause of economic loss on farm¹, due to nursing and treating affected stock, reduced growth rates and mortality of animals due to severe disease or euthanasia due to incurable joint ill. Whilst these problems are multi-factorial, navel treatment after birth has been recommended and used for decades to cleanse the navel and therefore help protect newborn lambs and calves from bacterial ingress.

NoBACZ Navel is being rigorously trialled so farmers can trust it offers durable and proven protection for the navel whilst it dries and heals.

Expertly designed

Developed specifically for navel and ear tag use on calves and lambs in conjunction with leading small ruminant veterinarian Fiona Lovatt BVSc PhD DSHP FHEA DipECSRHM FRCVS (Flock Health Ltd).

Lasting protection

NoBACZ Navel is a unique, patented solution that rapidly disinfects and dries the navel, and contains a natural coloured resin that forms a lasting waterproof seal at the site, keeping bacteria out.

Rapid dry time

Desiccates the navel in as little as 2 hours¹

Lasting protective barrier

Contains a unique patented formula - coats navel site after cleansing

Cleanses the site

Contains ethanol to disinfect the navel

Lick resistant

Contains a bitter agent to deter ewe interference

Application

When it comes to navels, it is essential there is full coverage of the umbilicus all the way up to the body wall.

Dipping navels tends to provide better 360° coverage.

If you are dipping then place the entire umbilicus in your preferred container and hold the container up against the lamb's body. Then raise the lamb with the jar held firmly against its abdomen so that the whole navel area is treated with NoBACZ Navel.

If you would rather spray your stock's navels then please ensure the whole length of the umbilicus is covered all the way up to, and including, the area of the stomach wall where the umbilicus begins.

Developed by NoBACZ Healthcare at the University of Cambridge

At NoBACZ, we stand at the forefront of next-generation products for ruminant health and infection protection.

As a spin-off from the University of Cambridge, our journey is rooted in cutting-edge research and innovation. We have harnessed the power of nature to create NoBACZ Healthcare.

NoBACZ's ruminant healthcare product family is built using our patented technology consisting of a natural biodegradable water-resistant resin complexed with metal salts.

Backed by our unwavering commitment to sustainability and proven results, NoBACZ Navel is set to reshape ruminant care.
